I followed best practices during code implementation, including proper naming conventions, branch naming, and creating PRs with clear descriptions and screenshots. I always perform thorough dev testing before creating 840 Dev and QA builds, and then generate a Bitrise build for QA verification. I ensure most issues are resolved before handing over to QA. I have completed all three timesheets, Leave Tracker on time without missing any entries. I have raised multiple PRs across different codebases, including React Native and Angular. Most of my PRs were approved without any major review comments. The few comments received were mainly related to future dependencies or application for in the Enablement team, I got the opportunity to write test cases for my own components. I wrote them well, achieving around 90% test coverage I regularly interacted with team members, leads, and the client-side BA to discuss delivery updates, clarify doubts, and resolve issues. I also actively communicated with client-side developers to ensure smooth coordination and understanding across to the Enablement	sed the testing build to QA on time.

In the Enablement	ge
Enablement	cated with client-side developers to ensure smooth coordination and understanding across teams
team, during Tamil's absence, I led both internal and client- side calls. I helped team members resolve their issues by coordinating with the client side when needed. I also contributed ideas that helped solve two major issues that helped solve two major issues one needed to the WebView implementation and another during the React Native version upgrade — thereby supporting overall team overall team.
